Treasurer: Sue Schauer

Places to go.....things to do.....

A team at Purdue University School of Veterinary Medicine conducted several studies to determine if vaccines can cause changes in the immune system of dogs that might lead to life-threatening immune-mediated diseases. They obviously conducted this research because concern already existed. It was sponsored by the Haywood Foundation which itself was looking for evidence that such changes in the human immune system might also be vaccine induced. It found the evidence.

The vaccinated, but not the non-vaccinated, dogs in the Purdue studies developed autoantibodies to many of their own biochemicals, including fibronectin, laminin, DNA, albumin, cytochrome C, cardiolipin and collagen. This means that the vaccinated dogs — "but not the non-vaccinated dogs"— were attacking their own fibronectin, which is involved in tissue repair, cell multiplication and growth, and differentiation between tissues and organs in a living organism.

The vaccinated Purdue dogs also developed autoantibodies to laminin, which is involved in many cellular activities including the adhesion, spreading, differentiation, proliferation and movement of cells. Vaccines thus appear to be capable of removing the natural intelligence of cells.

Autoantibodies to cardiolipin are frequently found in patients with

the serious disease systemic lupus erythematosus and also in individuals with other autoimmune diseases. The presence of elevated anti-cardiolipin antibodies is significantly associated with clots within the heart or blood vessels, in poor blood clotting, hemorrhage, bleeding into the skin, fetal loss and neurological conditions.

The Purdue studies also found that vaccinated dogs were developing autoantibodies to their own collagen. About one quarter of all the protein in the body is collagen. Collagen provides structure to our bodies, protecting and supporting the softer tissues and connecting them with the skeleton. It is no wonder that Canine Health Concern's 1997 study of 4,000 dogs showed a high number of dogs developing mobility problems shortly after they were vaccinated (noted in my 1997 book, *What Vets Don't Tell You About Vaccines*). Perhaps most worryingly, the Purdue studies found that the vaccinated dogs had developed autoantibodies to their own DNA. Did the alarm bells sound? Did the scientific community call a halt to the vaccination program? No. Instead, they stuck their fingers in the air, saying more research is needed to ascertain whether vaccines can cause genetic damage. Meanwhile, the study dogs were found good homes, but no long-term follow-

up has been conducted. At around the same time, the American Veterinary Medical Association (AVMA) Vaccine-Associated Feline Sarcoma Task Force initiated several studies to find out why 160,000 cats each year in the USA develop terminal cancer at their vaccine injection sites. The fact that cats can get vaccine-induced cancer has been acknowledged by veterinary bodies around the world, and even the British Government acknowledged it through its Working Group charged with the task of looking into canine and feline vaccines following pressure from Canine Health Concern. What do you imagine was the advice of the AVMA Task Force, veterinary bodies and governments? "Carry on vaccinating until we find out why vaccines are killing cats, and which cats are most likely to die."

In America, in an attempt to mitigate the problem, they're vaccinating cats in the tail or leg so they can amputate when cancer appears. Great advice if it's not your cat amongst the hundreds of thousands on the "oops" list.

But other species are okay — right? Wrong. In August 2003, the *Journal of Veterinary Medicine* carried an Italian study which showed that dogs also develop vaccine-induced cancers at their injection sites. We already

know that vaccine-site cancer is a possible sequel to human vaccines, too, since the Salk polio vaccine was said to carry a monkey retrovirus (from cultivating the vaccine on monkey organs) that produces inheritable cancer. The monkey retrovirus SV40 keeps turning up in human cancer sites. It is also widely acknowledged that vaccines can cause a fast-acting, usually fatal, disease called autoimmune hemolytic anemia (AIHA). Without treatment, and frequently with treatment, individuals can die in agony within a matter of days. Merck, itself a multinational vaccine manufacturer, states in *The Merck Manual of Diagnosis and Therapy* that autoimmune hemolytic anemia may be caused by modified live-virus vaccines, as do Tizard's *Veterinary Immunology* (4th edition) and the *Journal of Veterinary Internal Medicine*. The British Government's Working Group, despite being staffed by vaccine-industry consultants who say they are independent, also acknowledged this fact. However, no one warns the pet owners before their animals are subjected to an unnecessary booster, and very few owners are told why after their pets die of AIHA.

A Wide Range of Vaccine-induced Diseases

We also found some worrying correlations between vaccine events and the onset of arthritis in our 1997 survey. Our concerns were compounded by research in the human field.

The *New England Journal of Medicine*, for example, reported that it is possible to isolate the rubella virus from affected joints in children vaccinated against rubella. It also told of the isolation of viruses from the peripheral blood of women with prolonged arthritis following vaccination. Then, in 2000, CHC's findings were confirmed by research which showed that polyarthritis and other diseases like amyloidosis, which affects organs in dogs, were linked to the combined vaccine given to dogs. There is a huge body of research, despite the paucity of funding from the vaccine industry, to confirm that vaccines can cause a wide range of brain and central nervous system damage. Merck itself states in its *Manual* that vaccines (i.e., its own products) can cause encephalitis: brain inflammation/damage. In some cases, encephalitis involves lesions in the brain and throughout the central nervous system. Merck states that "examples are the encephalitides following measles, chickenpox, rubella, small-pox vaccination, vaccinia, and many other less well defined viral infections".

When the dog owners who took part in the CHC survey reported that their dogs developed short attention spans, 73.1% of the dogs did so within three months of a vaccine event. The same percentage of dogs was diagnosed with epilepsy within three months of a shot (but usually within days). We also found that 72.5% of dogs that were considered by their owners to be nervous and of a worrying disposition, first exhibited these traits within the three-month post-

vaccination period.

I would like to add for the sake of Oliver, my friend who suffered from paralyzed rear legs and death shortly after a vaccine shot, that "paresis" is listed in Merck's *Manual* as a symptom of encephalitis. This is defined as muscular weakness of a neural (brain) origin which involves partial or incomplete paralysis, resulting from lesions at any level of the descending pathway from the brain. Hind limb paralysis is one of the potential consequences. Encephalitis, incidentally, is a disease that can manifest across the scale from mild to severe and can also cause sudden death.

Organ failure must also be suspected when it occurs shortly after a vaccine event. Dr Larry Glickman, who spearheaded the Purdue research into post-vaccination biochemical changes in dogs, wrote in a letter to Cavalier Spaniel breeder Bet Hargreaves:

"Our ongoing studies of dogs show that following routine vaccination, there is a significant rise in the level of antibodies dogs produce against their own tissues. Some of these antibodies have been shown to target the thyroid gland, connective tissue such as that found in the valves of the heart, red blood cells, DNA, etc. I do believe that the heart conditions in Cavalier King Charles Spaniels could be the end result of repeated immunizations by vaccines containing tissue culture contaminants that cause a progressive immune response directed at connective tissue in the heart valves. The clinical manifestations would be more pronounced in dogs that have a genetic predisposition [although] the findings should be generally applicable to all dogs regardless of their breed."

I must mention here that Dr Glickman believes that vaccines are a necessary evil, but that safer vaccines need to be developed.

Vaccines Stimulate an Inflammatory Response

The word "allergy" is synonymous with "sensitivity" and "inflammation". It should, by rights, also be synonymous with the word "vaccination". This is what vaccines do: they sensitize (render allergic) an individual in the process of forcing them to develop antibodies to fight a disease threat. In other words, as is acknowledged and accepted, as part of the vaccine process the body will respond with inflammation. This may be apparently temporary or it may be longstanding. Holistic doctors and veterinarians have known this for at least 100 years. They talk about a wide range of inflammatory or "-itis" diseases which arise shortly after a vaccine event. Vaccines, in fact, plunge many individuals into an allergic state. Again, this is a disorder that ranges from mild all the way through to the suddenly fatal. Anaphylactic shock is the culmination: it's where an individual has a massive allergic reaction to a vaccine and will die within minutes if adrenaline or its

equivalent is not administered.

There are some individuals who are genetically not well placed to withstand the vaccine challenge. These are the people (and animals are "people", too) who have inherited faulty B and T cell function. B and T cells are components within the immune system which identify foreign invaders and destroy them, and hold the invader in memory so that they cannot cause future harm. However, where inflammatory responses are concerned, the immune system overreacts and causes unwanted effects such as allergies and other inflammatory conditions.

Merck warns in its *Manual* that patients with, or from families with, B and/or T cell immunodeficiency's should not receive live-virus vaccines due to the risk of severe or fatal infection. Elsewhere, it lists features of B and T cell immunodeficiency's as food allergies, inhalant allergies, eczema, dermatitis, neurological deterioration and heart disease. To translate, people with these conditions can die if they receive live-virus vaccines. Their immune systems are simply not competent enough to guarantee a healthy reaction to the viral assault from modified live-virus vaccines.

Modified live-virus (MLV) vaccines replicate in the patient until an immune response is provoked. If a defense isn't stimulated, then the vaccine continues to replicate until it gives the patient the very disease it was intending to prevent.

Alternatively, a deranged immune response will lead to inflammatory conditions such as arthritis, pancreatitis, colitis, encephalitis and any number of autoimmune diseases such as cancer and leukemia, where the body attacks its own cells.

A new theory, stumbled upon by Open University student Gary Smith, explains what holistic practitioners have been saying for a very long time. Here is what a few of the holistic vets have said in relation to their patients:

Dr Jean Dodds: "Many veterinarians trace the present problems with allergic and immunologic diseases to the introduction of MLV vaccines..."

Christina Chambeau, DVM: "Routine vaccinations are probably the worst thing that we do for our animals. They cause all types of illnesses, but not directly to where we would relate them definitely to be caused by the vaccine."

Martin Goldstein, DVM: "I think that vaccines...are leading killers of dogs and cats in America today."

Dr Charles E. Loops, DVM: "Homoeopathic veterinarians and other holistic practitioners have maintained for some time that vaccinations do more harm than they provide benefits."

Mike Kohn, DVM: "In response to this [vaccine] violation, there have been increased autoimmune diseases (allergies being one component), epilepsy, neoplasia [tumors], as well as behavioral prob-

lems in small animals."

A Theory on Inflammation

Gary Smith explains what observant healthcare practitioners have been saying for a very long time, but perhaps they've not understood why their observations led them to say it. His theory, incidentally, is causing a huge stir within the inner scientific sanctum. Some believe that his theory could lead to a cure for many diseases including cancer. For me, it explains why the vaccine process is inherently questionable.

Gary was learning about inflammation as part of his studies when he struck upon a theory so extraordinary that it could have implications for the treatment of almost every inflammatory disease — including Alzheimer's, Parkinson's, rheumatoid arthritis and even HIV and AIDS.

Gary's theory questions the received wisdom that when a person gets ill, the inflammation that occurs around the infected area helps it to heal. He claims that, in reality, inflammation prevents the body from recognizing a foreign substance and therefore serves as a hiding place for invaders. The inflammation occurs when at-risk cells produce receptors called All (known as angiotensin II type I receptors). He says that while At1 has a balancing receptor, At2, which is supposed to switch off the inflammation, in most diseases this does not happen.

"Cancer has been described as the wound that never heals," he says. "All successful cancers are surrounded by inflammation. Commonly this is thought to be the body's reaction to try to fight the cancer, but this is not the case.

"The inflammation is not the body trying to fight the infection. It is actually the virus or bacteria deliberately causing inflammation in order to hide from the immune system [author's emphasis]."

If Gary is right, then the inflammatory process so commonly stimulated by vaccines is not, as hitherto assumed, a necessarily acceptable sign. Instead, it could be a sign that the viral or bacterial component, or the adjuvant (which, containing foreign protein, is seen as an invader by the immune system), in the vaccine is winning by stealth.

If Gary is correct in believing that the inflammatory response is not protective but a sign that invasion is taking place under cover of darkness, vaccines are certainly not the friends we thought they were. They are undercover assassins working on behalf of the enemy, and vets and medical doctors are unwittingly acting as collaborators. Worse, we animal guardians and parents are actually paying doctors and vets to unwittingly betray our loved ones.

Potentially, vaccines are the stealth bomb of the medical world. They are used to catapult invaders inside the castle walls where they can wreak havoc, with none of us any the wiser. So rather than experiencing frank viral diseases such as the 'flu, measles, mumps and rubella (and, in the case of dogs, parvovirus and distemper), we are

allowing the viruses to win anyway – but with cancer, leukemia and other inflammatory or autoimmune (self-attacking) diseases taking their place.

The Final Insult

All 27 veterinary schools in North America have changed their protocols for vaccinating dogs and cats along the following lines; however, vets in practice are reluctant to listen to these changed protocols and official veterinary bodies in the UK and other countries are ignoring the following facts.

Dogs' and cats' immune systems mature fully at six months. If modified live-virus vaccine is given after six months of age, it produces immunity, which is good for the life of the pet. If another MLV vaccine is given a year later, the antibodies from the first vaccine neutralize the antigens of the second vaccine and there is little or no effect. The litre is no "boosted", nor are more memory cells induced.

Not only are annual boosters unnecessary, but they subject the pet to potential risks such as allergic reactions and immune-mediated hemolytic anemia.

In plain language, veterinary schools in America, plus the American Veterinary Medical Association, have looked at studies to show how long vaccines last and they have concluded and announced that annual vaccination is unnecessary. Further, they have acknowledged that vaccines are not without harm. Dr Ron Schultz, head of pathobiology at Wisconsin University and a leading light in this field, has been saying this politely to his veterinary colleagues since the 1980s. I've been saying it for the past 12 years. But change is so long in coming and, in the meantime, hundreds of thousands of animals are dying every year – unnecessarily.

The good news is that thousands of animal lovers (but not enough) have heard what we've been saying. Canine Health Concern members around the world use real food as Nature's supreme disease preventative, eschewing processed pet food, and minimize the vaccine risk. Some of us, myself included, have chosen not to vaccinate our pets at all. Our reward is healthy and long-lived dogs.

It has taken but one paragraph to tell you the good and simple news. The gratitude I feel each day, when I embrace my healthy dogs, stretches from the center of the Earth to the Universe and beyond.

CATHERINE O'DRISCOLL is the founder of Canine Health Concern, a non-profit organization that seeks to help dog owners raise healthy, happy, vibrant dogs. She has brought the truth about pet vaccines to light, and promotes natural canine health care. Her books "Shock To The System" and "What Vets Don't Tell You About Vaccines" have opened the eyes of thousands of pet owners worldwide.

HUGG
Congrats!

To Pat and
Raja on
their
OTCH!!
Way to GO
Girls!!!

**Miniature Schnauzer Club of Michigan
Annual CERF Clinic
Sunday, June 26, 2011**

Dr. Patricia Gearhart ACVO
—Starting at 9:00am—
\$30 per dog

Your dog's registration information will be needed for eye checks

POTLUCK LUNCH-Starts at 12:00 Noon

Please call Debbie at (517) 522-4173 or e-mail at sercatep@yahoo.com with reservations for eye checks and lunch. Please let her know what you plan on bringing for the potluck
Remember to bring lawn chairs, exercise pens

Business Meeting-Immediately following Lunch

If you wish to discuss a matter, have your information ready. Committees, be ready with your reports. This will help to keep time to a minimum.

This is being held at the home of Debbie & Del Herrell
13551 Phal Rd, Grass lake, MI 49240

GUESTS ARE ALWAYS WELCOME!!!

DIRECTIONS: I-94 from the East: Exit 157 Pierce Rd. – at the end of the exit turn left (old US-12 Michigan Ave.) Go 4 1/2 miles to Francisco Rd., turn left. Go to stop sign. Turn right on to Grass Lake Rd. Go 1/2 mile to Fishville Rd. Turn left. After S curve is Phal Rd. Turn right (only goes to the right) to the second house on the left (farm)

I-94 from the West: Grass Lake Exit (Mt. Hope Rd.) at the end of the exit turn right onto Mt. Hope Rd. Go to the stop light. Turn left on to Michigan Ave. Go approximately one mile to Norvell Rd. Turn right, continue through 4-way stop to the next cross road. Turn left onto Phal Rd. Go 1 1/2 miles. Farm is on the right

2011 Calendar of Important Events

JUNE 26-

Annual MSCM Outdoor Potluck Meeting & Eye Clinic at Debbie Herrell's, Grass Lake

JULY 29-

MSCM Second Agility trial-Dexter, MI

SEPTEMBER 30 -

MSCM Fall Specialty Show-Monroe, MI-Monroe County Fairgrounds

A Note From Club Member Joanne McCallum:

I wanted to Thank you all for your kind sympathy and prayers for R-Jos Fire-cracker Born on July 4, (7-3-09)-(4-12-11) Uncle Sam was loaned to us for a short time. His charm brought joy to our hearts. We have many fond memories of him. I was proud to be by his side at his first AKC Trial as we earned a BIG 198 . We had been practicing agility, hoping to be ready for the May Agility Trials. Now Uncle Sam runs with the angels.

Sincerely, Dick, Joanne, Bootsie and Shasta McCallum

Editor - Joanne Forster

We're on the Web!

www.miniatureschnauzerclubofmichigan.org

The objective of the Miniature Schnauzer Club of Michigan is to advance the principals and scientific practices in the breeding of purebred Miniature Schnauzers: foster co-operation between breeder, owner, and veterinarian; encourage the exchange of information and experience among the club members and between show-giving clubs; to conduct sanctioned and licensed specialty shows and matches; and to encourage the adherence to the high standards of conduct and to the rules and regulations of the American Kennel Club.

Happy Mother's Day!

To all of you who have children that are a bit hairier than others and walk on four paws!

This is for the mothers who have sat up all night with sick dogs in their arms, wiping up barf laced with edible and inedible things and saying 'It's okay baby, Mommy's here.'

Who have sat on the floor for hours on end soothing dogs who can't be comforted.

This is for all the mothers who show up at work with dog hair on their suits and poo bags in their purse, coat pocket, pants pocket and all other pockets.

For all the mothers who make their own dog food and treats.

And all the mothers who DON'T.

This for the mothers who help the new mothers deal with the loss of their litter. And the mothers who help them cope when they are given new homes.

This is for the mothers whose priceless art collections consists of ribbons and photos.

And for all the mothers who froze their buns off, sweated gallons and swatted away bees to watch their precious prance into a ring and achieve

2nd place and then jump around as though they had won best in show.

This is for all the mothers who yell at their dogs in the park and firmly tug the leash to get their attention.

And for all the mothers who count to ten because they realize how animal abuse happens.

This is for all the mothers who go to the special pet stores to collect the proper treats, food and toys no matter that it take 3 stops and 50 stoplights.

This is for all the mothers who taught their dogs to sit, come and stay.

And for all the mothers who opted for sit.

This is for all the mothers who teach their dogs agility and obedience and actually understand that it needs to be FUN!

This is for every mother who automatically sucks in their breath when she can't see a leash on a dog in the non-fenced front yard, then relaxes when she realizes that the dog is sitting on it.

This is for all the mothers who took their dog to the vet assuring them that there would be no needles only to be told they need a blood sample.

For all the mothers whose dog has gone missing and was returned because she had the forethought to have chip put between its shoulders.

What makes a good Mother anyway?

Is it patience? Compassion? Ever available treats?

The ability to answer the door, hold back the dog and deal with a phone call all at the same time?

Or is it in her heart?

Is it the ache you feel when you walk out the door to your job every Monday through Friday knowing that 2 eyes are boring into your back?

The jolt that takes you from sleep to dread when you hear the sounds of heaving at 2:00am?

Years later, the guilt that won't go away when you have no other choice but to put your friend down?

The emotions of motherhood are universal and so this is for you all. For all of us...

Hang in there. In the end we can only do the best we can. Tell them everyday that we love them. And never stop being a Mom

Braggs

On March 6, 2011 at the Detroit Kennel Club Show, Donnella's Enchanting Lucius went WD for a 3 point major! The judge was Breeder/Judge David Kirkland. Lucius was handled by Beth Santure and is owned and bred by Donna Giles.

Congratulations!

7 Things You Didn't Know About Puppy Mills

- 1) There is no such thing as a "puppy mill". "Puppy mill" is not a legally defined term, it is slang used by the animal rights community to denigrate any and all breeders -- small or large, standard or substandard. It's the "N-word" of breeders. The phrase "puppy mill" has been promoted in the media by the animal "rights" movement, people who want to end all animal ownership. It is applied indiscriminately by these fanatics to anyone who breeds dogs.
- 2) There are three types of breeders: Commercial, Pet and Hobby/show breeders. Every one of these can be a large-scale breeder, every one of these can be a substandard breeder. Commercial kennels are subject to state and/or federal oversight. Substandard care can be found with all types of breeders. It is about the standard of care, NOT the numbers.
- 3) Many commercial breeders have state of the art kennels that meet USDA standards and the standards of their state laws. They are inspected at least yearly and must meet or exceed standards far higher than those expected of the average hobby breeder.

4)"Sick" puppies do not sell. It is counterproductive for any industry to produce a defective product and expect to stay in business.

5) Passing laws intended to outlaw "puppy mills" will not solve any problem. Most substandard breeders are already in violation of existing laws. New, stricter laws will only affect those who are already working to follow the laws. The only way to have any effect is to enforce the laws that are already on the books.

6) All the hobby breeders in this country cannot produce enough puppies to meet the demands of the American market.

7) BREEDERS are NOT responsible for the presence of dogs in shelters— Owners are!

Agility
